

# The Future of History

Because of the speed of light, as the universe expands, all galaxies, stars, and systems will eventually be so far away they'll be undetectable by any instrument of our science.

They will have disappeared from our real and technological sight and eventually maybe from our history books. Everything in the universe before the time of undetectability will become part of our pre-history.

Will future generation of humans even know that anything outside our Milky Way galaxy ever existed?
