

Room Reading

INDUSTRIAL GRADE

Some can quickly and with virtually full understanding, read books.

Can some people do the same with rooms?

Could a person enter a room full of strangers, furtively scan, and then intuitively make high-probability inferences about power relationships between the people? This achievement would require understanding the general and specific contexts. It would also require perception of clothing, posture, physical orientation, physical proximity, energy level, engagement level, and the degree to which perceptible groupings were related or not related. If a person did this, could they not be extremely dangerous?
