

# Questions and Faith

Guided by the “certainty” of mathematics, scientists hypothesize, measure, test, and maybe re-hypothesize, all for the purpose of acquiring knowledge of the physical world, knowledge which presumably approaches certainty. Some of the questions their hypotheses ask and some of the results they achieve are quite interesting.

Questions of more interest are beyond the reach of science to answer; these cannot be known, only believed.

For example, *what is the best way to organize society?*

Questions of the most interest in life are beyond even belief. For instance, *what is ultimately true?*
